

Ek:

Dear Handan,

Thank you for your feedback and detailed analysis. Below are my thoughts in response to the questions you raised:

A) Possible Reasons for the Difference Between ContactCSAT and Self-ServiceCSAT

When users are hungry and experience order delays, they can become quite stressed and impatient. This stress can be exacerbated when self-service channels fail to provide effective solutions. Self-service channels are typically programmed to handle a specific set of issues and may struggle with more complex problems. As a result, users who cannot resolve their issues with a program may become frustrated and express their dissatisfaction through lower CSAT scores. Especially when users are hungry and facing delays, the frustration with the self-service channel can become more pronounced.

B) Proposed Changes to the Self-Service Flow

1. **Expanded Issue Range:** To improve the user experience, the self-service channel should offer a broad range of issues that users can report. This will help users quickly identify and report their specific problems.
2. **Advanced Wizard Bot:** After users identify their issues, they should be guided by an advanced bot that provides personalized responses. This bot can offer more flexible solutions and direct users to further assistance if it cannot resolve the issue.

3. **Live Support Referral:** If the advanced bot cannot resolve the issue, users should be directed to live support. This transition can provide users with faster and more effective solutions for complex problems, improving overall satisfaction.

These suggestions aim to enhance the self-service channel and reduce dissatisfaction. Thank you again for your insights and suggestions. If you have any further information or need additional support, please feel free to reach out.

Best regards,

Muhammed Emin Sayan
